

Guidelines for statement classification

These guidelines assume that the statement is valid. The annotator should take the following steps to perform the classification:

- (I) Classify the statement as one of the following: citation statement (C), linguistic statement (L), structural statement (S), or others (O).
- (II) If it is an L statement, further classify it as specific (L-spec), typological (L-typo), or theoretical (L-theo).
- (III) If it is an L-spec statement, specify the language.

(I) Types of linguistic statements

1. Citation statement (Type C):

A statement is considered to be of type C if the author attributes the claims in the statement to the cited paper, e.g., "As noted by Chomsky (1995), the minimal link condition applies."

2. Linguistic statement (Type L):

A statement is considered to be of type L if the authors themselves assert the claim(s) in the statement without attributing them to others.

Please note that for potentially ambiguous cases, if the statement is "according to" a rule or principle (e.g., "According to MiD, processing efficiency increases when ..."), it is of type L, even if the rule or principle was attributed earlier to a paper or person. However if the statement is "according to" a paper or person, then it is of Type C.

3. Structural (Type S):

A statement that does not make any scientific claim is considered to be Type S. This

includes:

- Section titles ("3.2 Theoretical Background");
- Definitions ("We define <term> as ...");
- Meta-discourse, such as signposting ("The authors studied...")
- Organizational text regarding the paper itself ("Section X will review the literature"). Information on data ("our dataset contains 1200 sentences")
- Description of methodology (We use the Fisher test to establish ..."; "We asked 12 native speakers to describe the picture.")
- Technical and algorithmic results ("It took 12 seconds for our algorithm to finish processing the dataset"; "20% of the recordings were rejected for poor sound quality").

(II) Subtypes of linguistic statement

(2.1) Linguistic Statements - Theoretical (Type L-Theo):

A theoretical linguistic statement makes generalizations or claims may fall into one of the following cases:

- Theory-internal (e.g., "Move- α is optionally blocked by locality constraints.")
- The statement cannot be directly verifiable even with relevant language data such as treebanks, raw corpora, and derived parsers (e.g., "P(reposition)-omission under sluicing is an important point for the analysis of ellipsis"; "The major mismatch between sluices and verbal interrogatives may cast doubt on syntactic theories that derive sluices from verbal interrogatives.")

For each (atomic) T-Theo statement, the unique concerned language must also be annotated.

(2.2) Linguistic Statements - Specific (Type L-Spec):

A specific linguistic statement makes a claim about a specific language ("Warlpirli is mostly SOV"; language="Warlpirli"). It should not make any comparison with other languages (such as "Polish is similar to Russian in terms of ...").

For each (atomic) L-Spec statement, the unique concerned language must also be annotated.

(2.3) Linguistic Statements - Typological (Type L-Typo):

A typological linguistic statement describes cross-linguistic phenomena ("All languages with VSO order have prepositions.") or makes comparisons on a set of languages ("Sino-Tibetan languages tend to be more <property> than Indo-European languages"; "Polish is similar to Russian in terms of ...").
